Methods are described by means of which multiconstitu-  
ent mixtures such as occur in petroleum oils and in  
fuels and lubricants obtained by hydrogenation can be  
characterized by just two characteristic constants, the  
density and the index of refraction. The method thus  
broadly meets the requirement of the industrial chemist  
for controlling the course of production by a quick,  
simple means which make minimum demands on the  
technical personnel. Homograms for the evaluation of  
specific industrially-produced fractions are included.
